

SMA-1 architecture — a structure-mapping retrieval memory

LOAD & REGISTER

MATCH & DECIDE

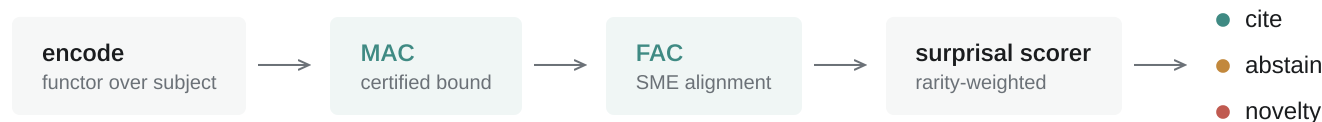

Fig. M | SMA-1 mounts any open ontology, then matches and decides by structural alignment. Load & register, a universal loader ingests open ontology formats (OBO, OWL, STIX, CPC), normalizes them into an is-a + typed-relation geometry, builds higher-order cases as functor statements, and registers them behind a per-query router. Match & decide, a query is encoded as a functor over its subject; MAC returns a certified admissible-bound shortlist, FAC performs structure-mapping (SME) alignment, and a rarity-weighted surprisal scorer routes the result to cite, abstain, or novelty.
